

Claims

1. A display device comprising a plurality of parallelepipeds arranged in a stack, each parallelepiped having a resilient means for urging it from a closed position, in which it lies generally flat, to a fully opened position, the structure being foldable from a first position at which the stack of parallelepipeds are fully open to a second position at which they are fully folded.
2. A device as claimed in Claim 1, including a foldable sheet which is connected to a face of the stack such that in the first position the sheet is substantially planar and in the second position the sheet is flattened concertina fashion, the sheet bearing a desired image, such as an advertising image, on its main face.
3. A device as claimed in Claim 2, wherein the foldable sheet is hingably attached to a base upon which the stack lies.
4. A device as claimed in Claim 1 or 3, including one or more members, which bear at least part of the resilient means, and define the fully opened position.
5. A device as claimed in Claim 4, wherein the members comprise one or more diagonally disposed members fixed to a junction between one adjacent pair of panels of the parallelepiped and adapted to impinge towards the diametrically opposite junction when the parallelepiped is fully opened.
6. A device as claimed in Claim 4 or 5, wherein the members comprise one or more layers of diagonally disposed members, the ends of pairs of which members are brought towards each other under the action of the resilient means.
7. A device as claimed in Claim 6, wherein each diagonal layer includes a longitudinal slot in which slides a tongue part of a respective second diagonal layer which slides relative to the first layer.
